

XM radio is the most valuable and dependable radio service that exists today. It is especially beneficial while traveling and while in zones where there is no local radio. Having the weather reports through this resource is invaluable as there is no other way to receive such information in many rural areas of the United States. To cite just one example, the area around Spruce Knob, W.Va. which is used by many people in astronomy is a radio free zone. There are no broadcast radio stations receivable in the area. Since becoming a user of XM I have not had reason to access any other radio signal. If XM is denied the right to broadcast weather information you will be denying me access to valuable information which will not otherwise be available. Please leave a good thing alone.
